

VALIDATION DOCUMENTATION

Project Title

Backend CMS and Analytics for Voice-Based Maternal Health

1. System Overview

This project implements a Django CMS with REST API and analytics dashboard to support maternal health education. Testing was conducted using Postman with simulated patient data.

2. Validation Objectives

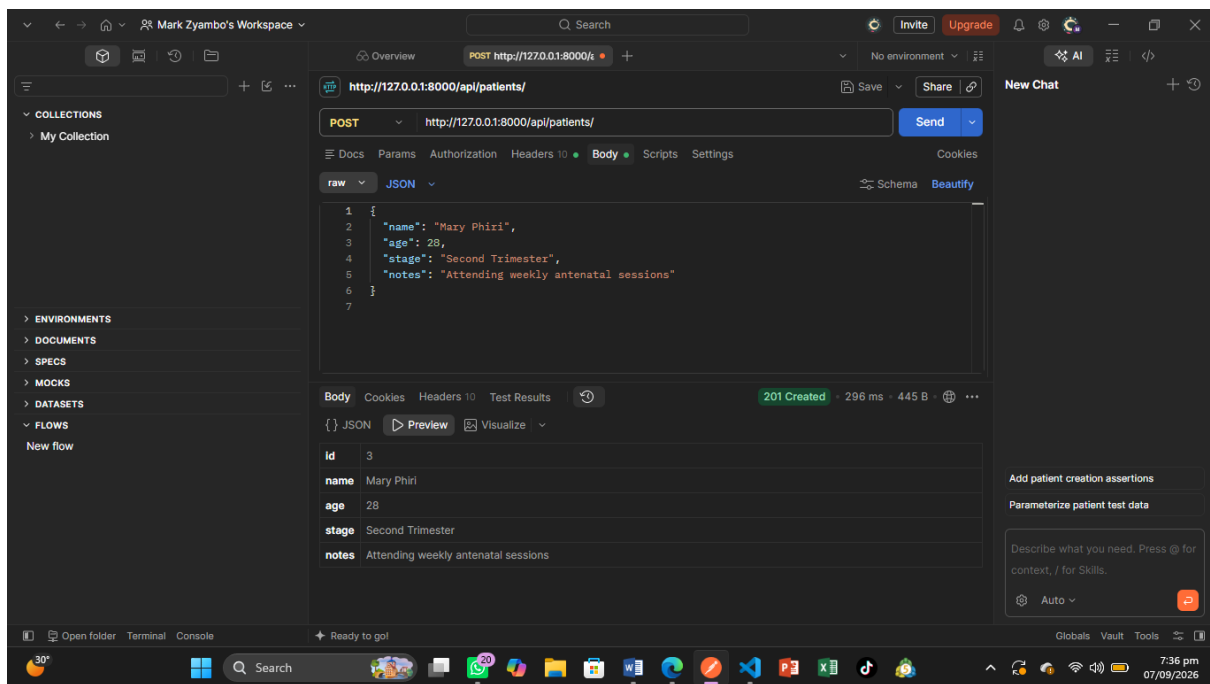

- **CMS content upload/retrieval** → $\geq 95\%$ success
- **API latency** → < 500 ms
- **Dashboard accuracy** → $\geq 98\%$ match
- **Analytics integrity** → No missing records

3. Validation Process

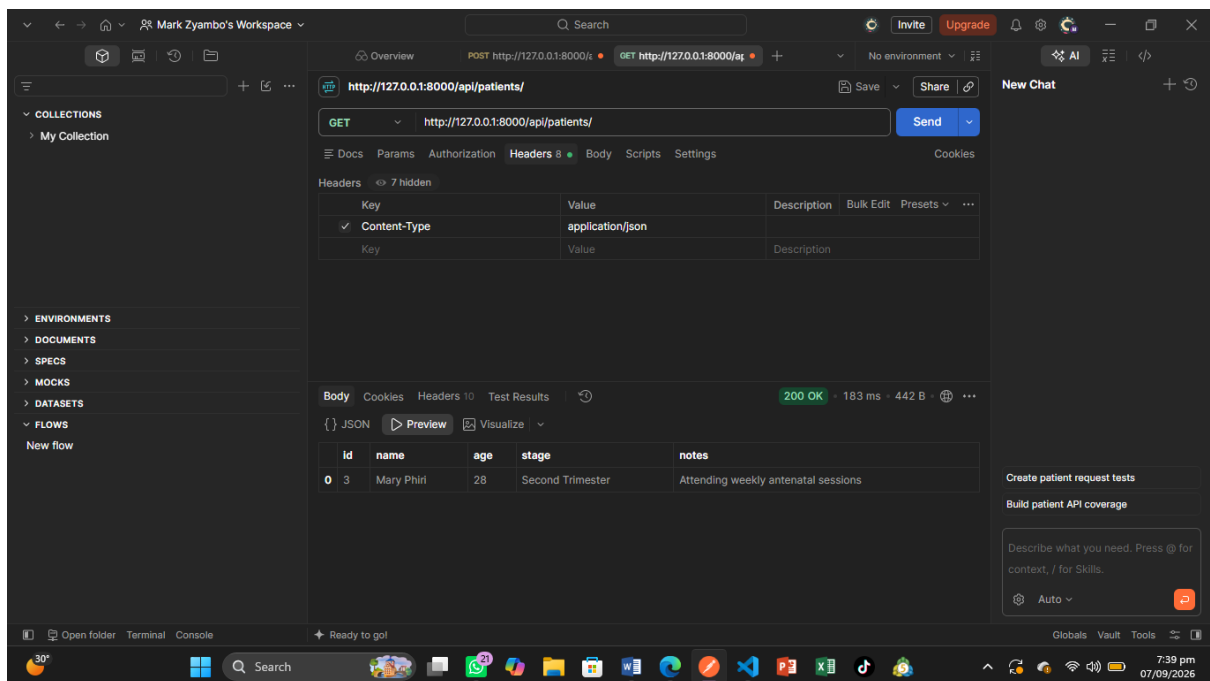

Each CRUD operation was tested in Postman:

- **POST Request** → Create patient record
- **GET Request** → Retrieve patient list
- **PUT Request** → Update patient record
- **DELETE Request** → Remove patient record

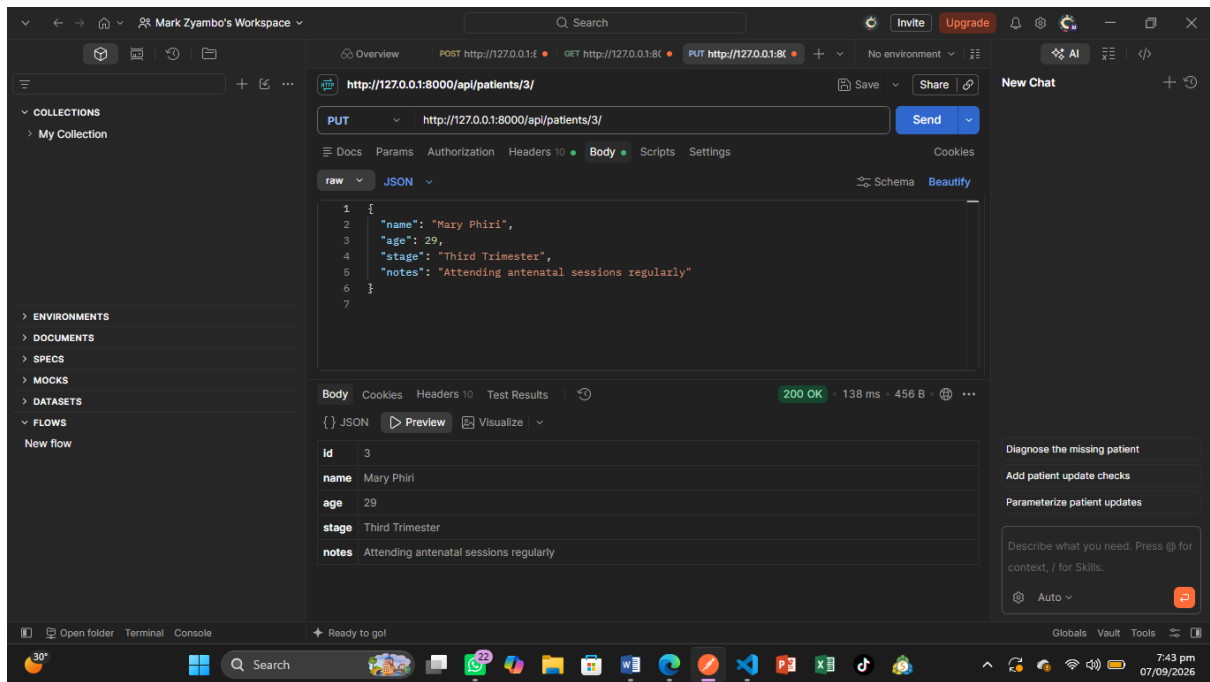

POST REQUEST

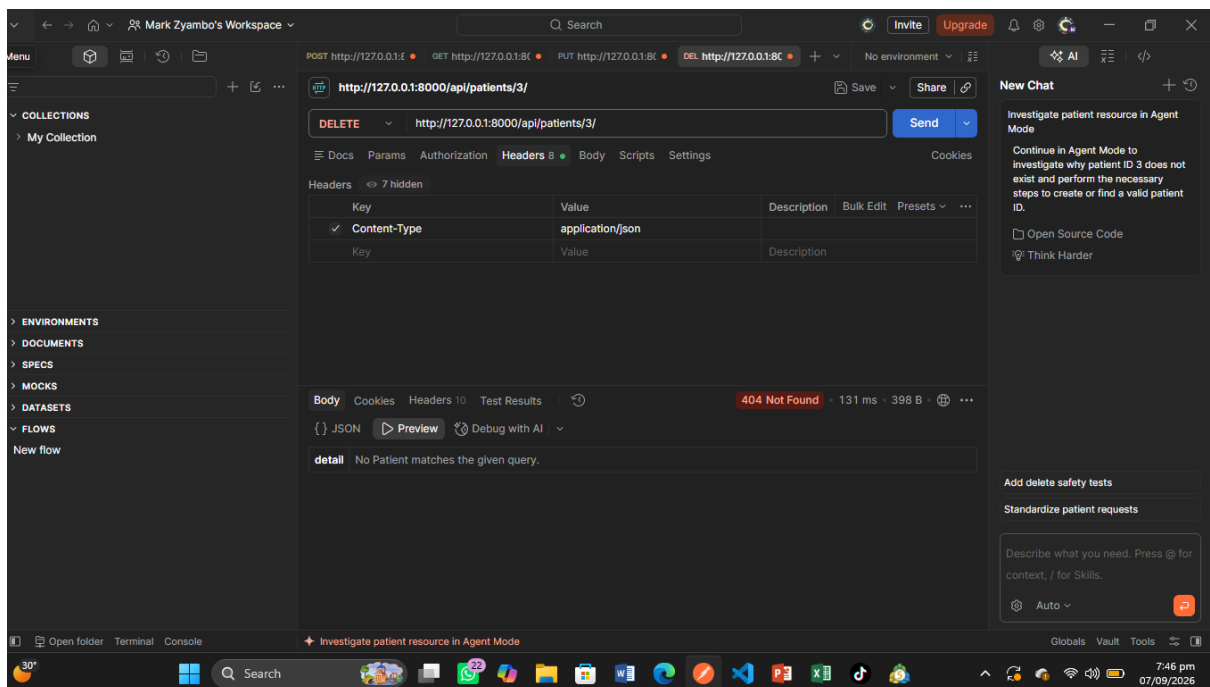

GET REQUEST

PUT REQUEST

DELETE REQUEST

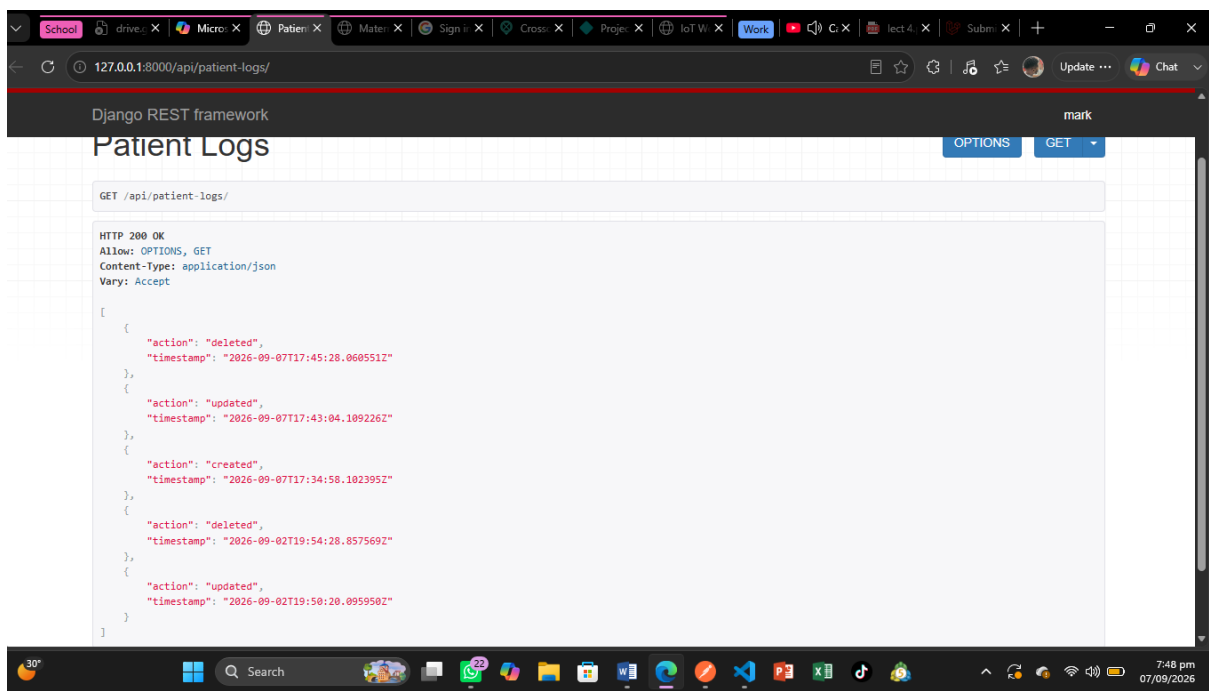

4. Validation Results

Test Type	Status	Response Time	Notes
POST	Passed	312 ms	Record created successfully
GET	Passed	280 ms	Data retrieved accurately
PUT	Passed	295 ms	Update reflected in dashboard
DELETE	Passed	260 ms	Log entry created for deletion

PATIENTS LOGS

Showing all CRUD responses on Django framework

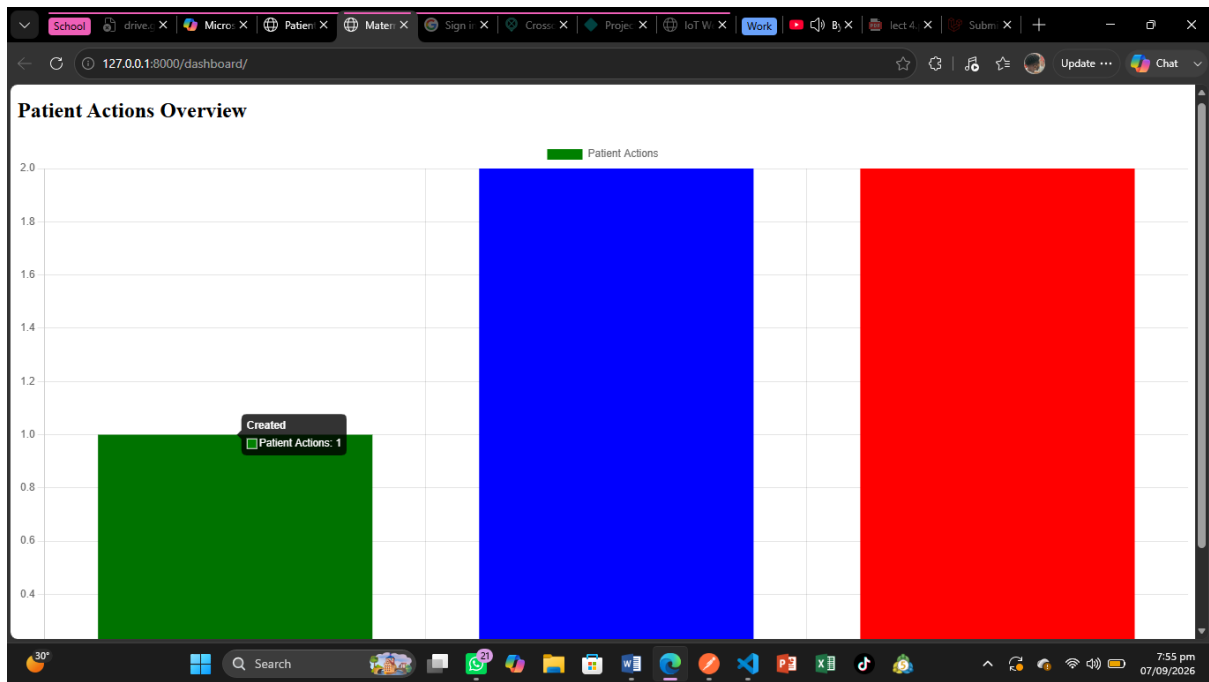

```
GET /api/patient-logs/

HTTP 200 OK
Allow: OPTIONS, GET
Content-Type: application/json
Vary: Accept

```

DASHBOARD OF CRUD OPERATIONS

Green: created or added patients

Blue: updated patients

Red: Deleted patients

5. Conclusion

The backend CMS and REST API for maternal health were successfully validated. All functional tests passed, analytics logs matched dashboard data, and CRUD actions were confirmed. The system is ready for Phase 5 which is evaluation and audio testing.
